

The enhanced nutrient cycle in the soil enhances the level of photosynthesis by the trees.

The enhanced level of photosynthesis enhances the flow of nutrients from the roots to the mycorrhizal fungi.

The mycorrhizal fungi supply the trees with nutrients in exchange for carbohydrates.

Organisms living in the soil eat the fungi, releasing their nutrients in the soil to be taken up by the trees.

COOPERATION BELOW THE GROUND

The trees, the mycorrhizal fungi and the animals eating the fungi are all part of a system of cooperation that enhances the efficiency of photosynthesis of the forest, i.e. its productivity.

NO RIGHT FOR CONTAMINATION

Global Ban on GM Trees
